API Security Testing Report – Pickup API

Objective

Evaluate the security and validation mechanisms of the Create Pickup API endpoint.

Endpoint

POST https://stg-app.bosta.co/api/v2/pickups

Authentication

Bearer Token generated using POST /api/v2/users/generate-token-for-interview-task

Testing Methodology

Testing was conducted using Postman with various malformed payloads, invalid tokens, and injection attempts to evaluate security controls.

Key Findings

- Authentication enforcement verified (401 when missing token).
- Input validation present for parcel numbers and required fields.
- SQL injection attempts rejected.
- Email format validation enforced.

Conclusion

The API demonstrates proper validation and authentication enforcement. Further testing could include rate limiting and fuzz testing.
